# Agenda

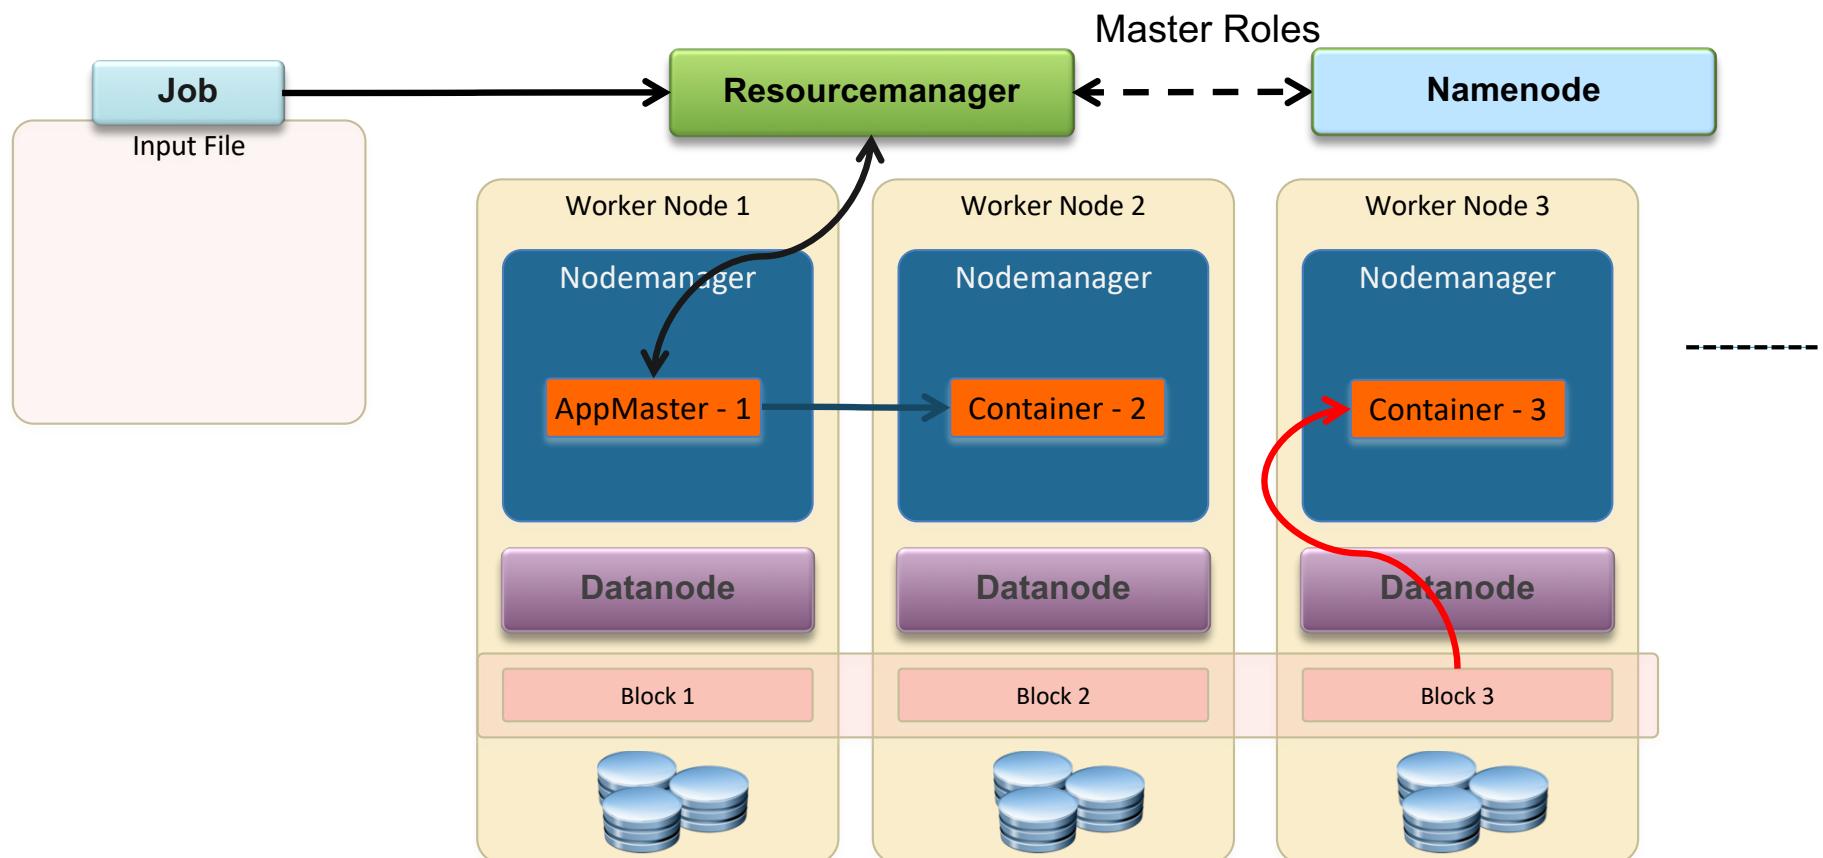

- Why Virtualize Spark?
- A Review of the Architectures
- What does Virtualized Spark look like?
- Virtualizing Spark in the Private Cloud and Public Cloud – using the same infrastructure
- VMware Cloud on AWS – a platform for Spark in the public cloud
- Performance
- A Key Best Practice
- Conclusions

# Why Virtualize Spark?

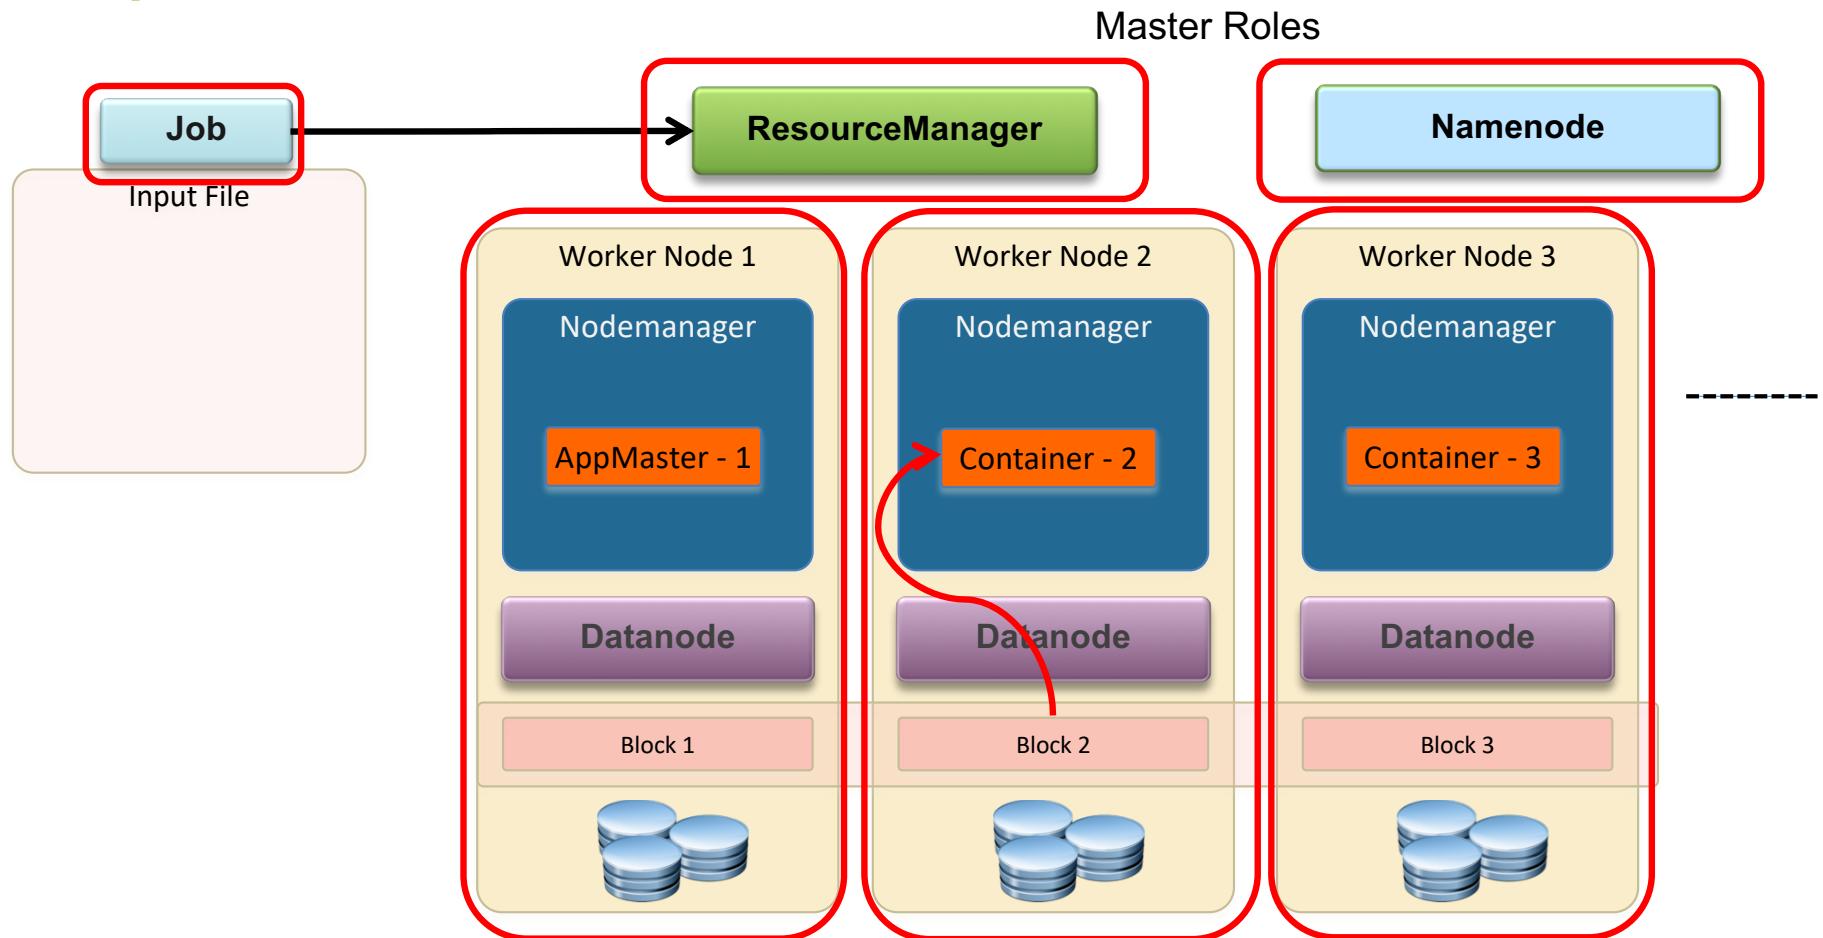

# Use Cases : Virtualization of Big Data

- Enterprises have development, test, pre-prod staging and production clusters that are required to be separated from each other and provisioned independently
- Organizations need different versions of Spark to be available to different teams - with possibly different services available
- Enterprises do not wish to dedicate a specific set of hardware to each different requirement above, and want to reduce overall costs

Using the Same Infrastructure

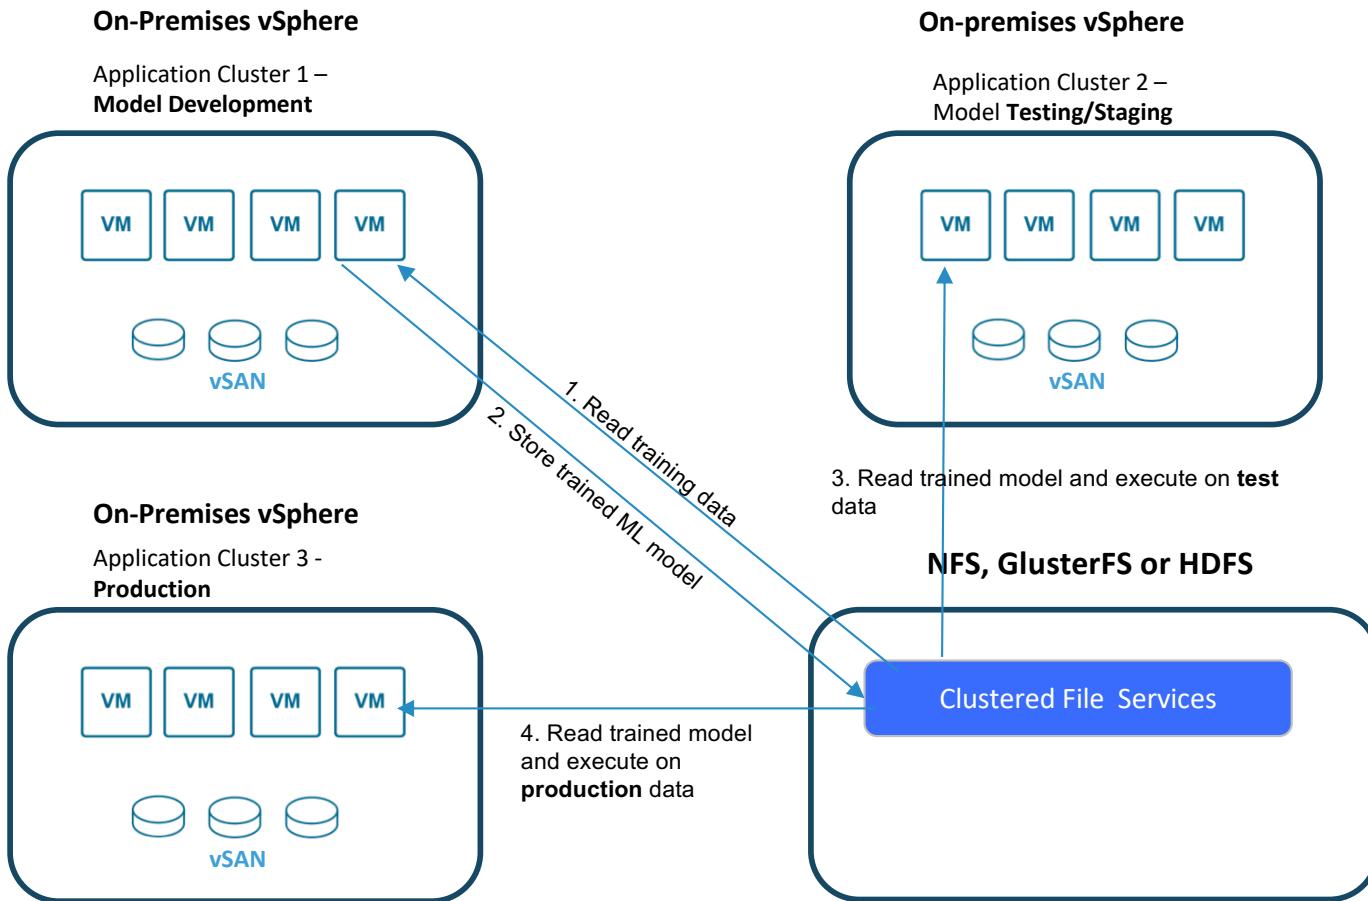

# High Level View of Spark

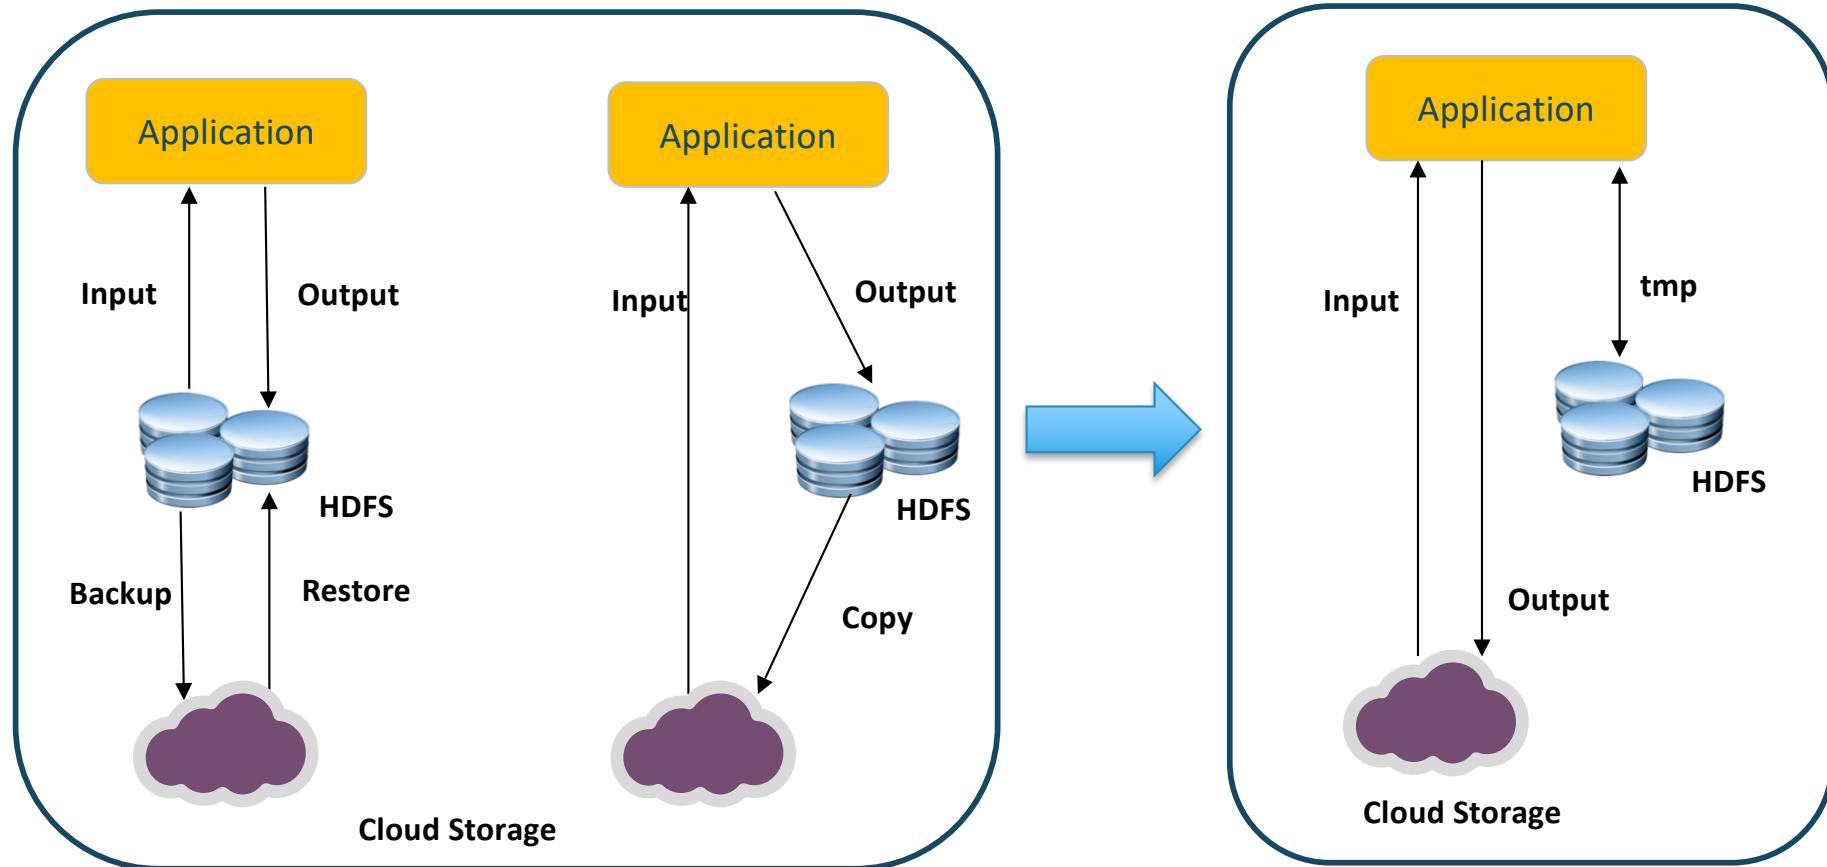

# Deploying Spark in the Private Cloud

# Big Data - Storage Evolution

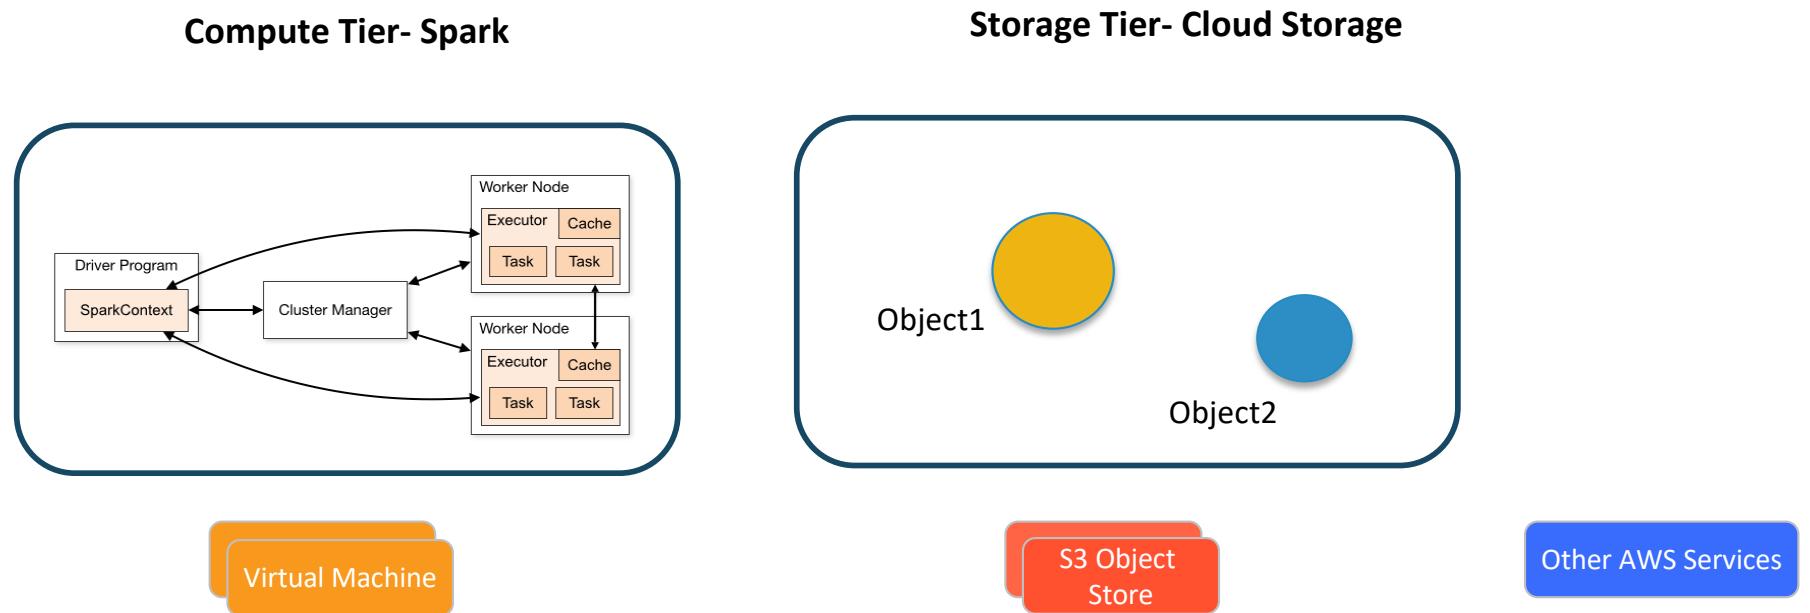

# Evolving Cloud Storage for Big Data

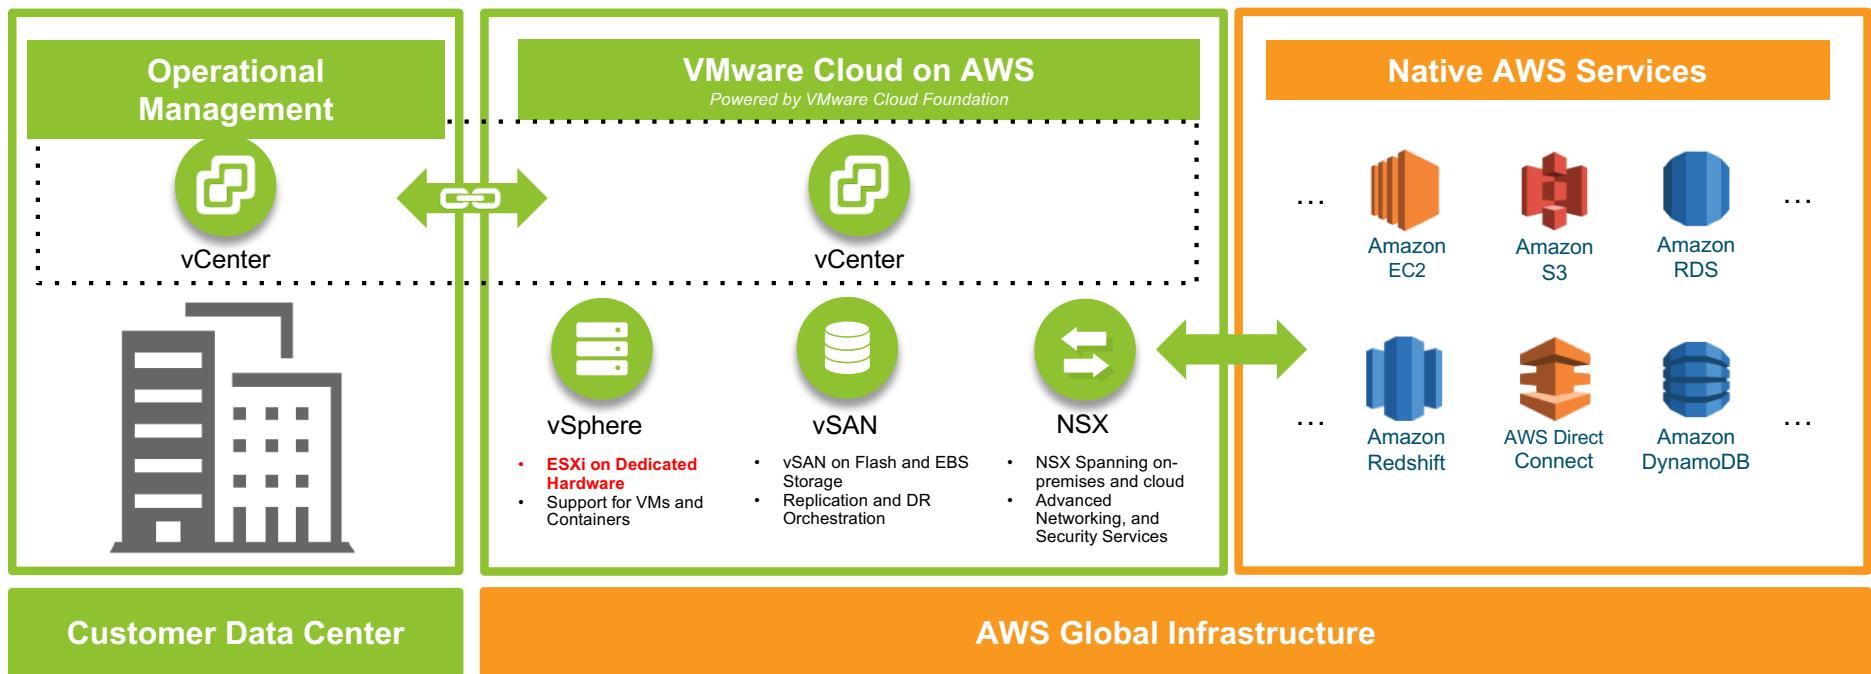

## – S3 for Big Data

- S3 is an Object storage system rather than a file system
- Moving existing HDFS data to S3 requires care (file-> object mapping)
- S3 is **eventually consistent**
- Guard mechanisms like S3Guard to ensure file consistency
- Caching locally to improve performance of storage access

# Deploying Spark in the Public Cloud

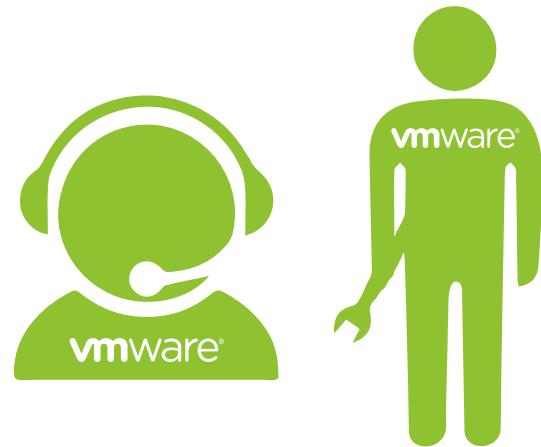

# VMware Cloud on AWS

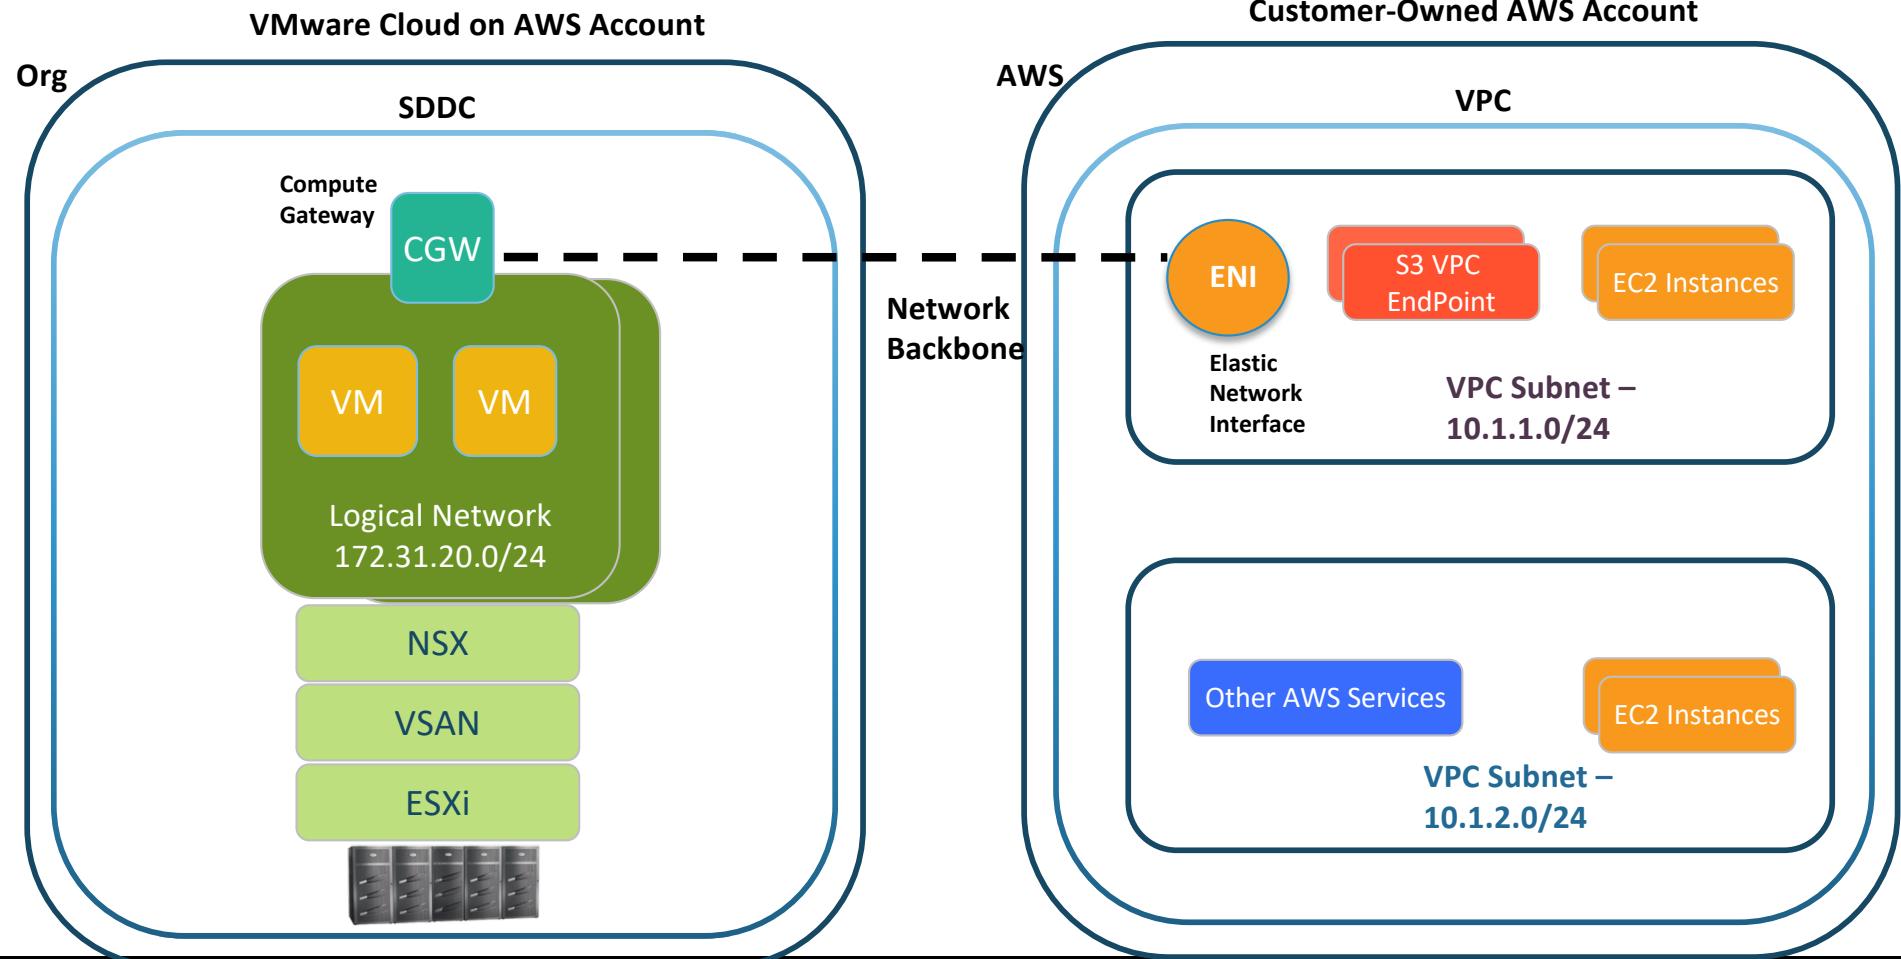

# Sold as a Service

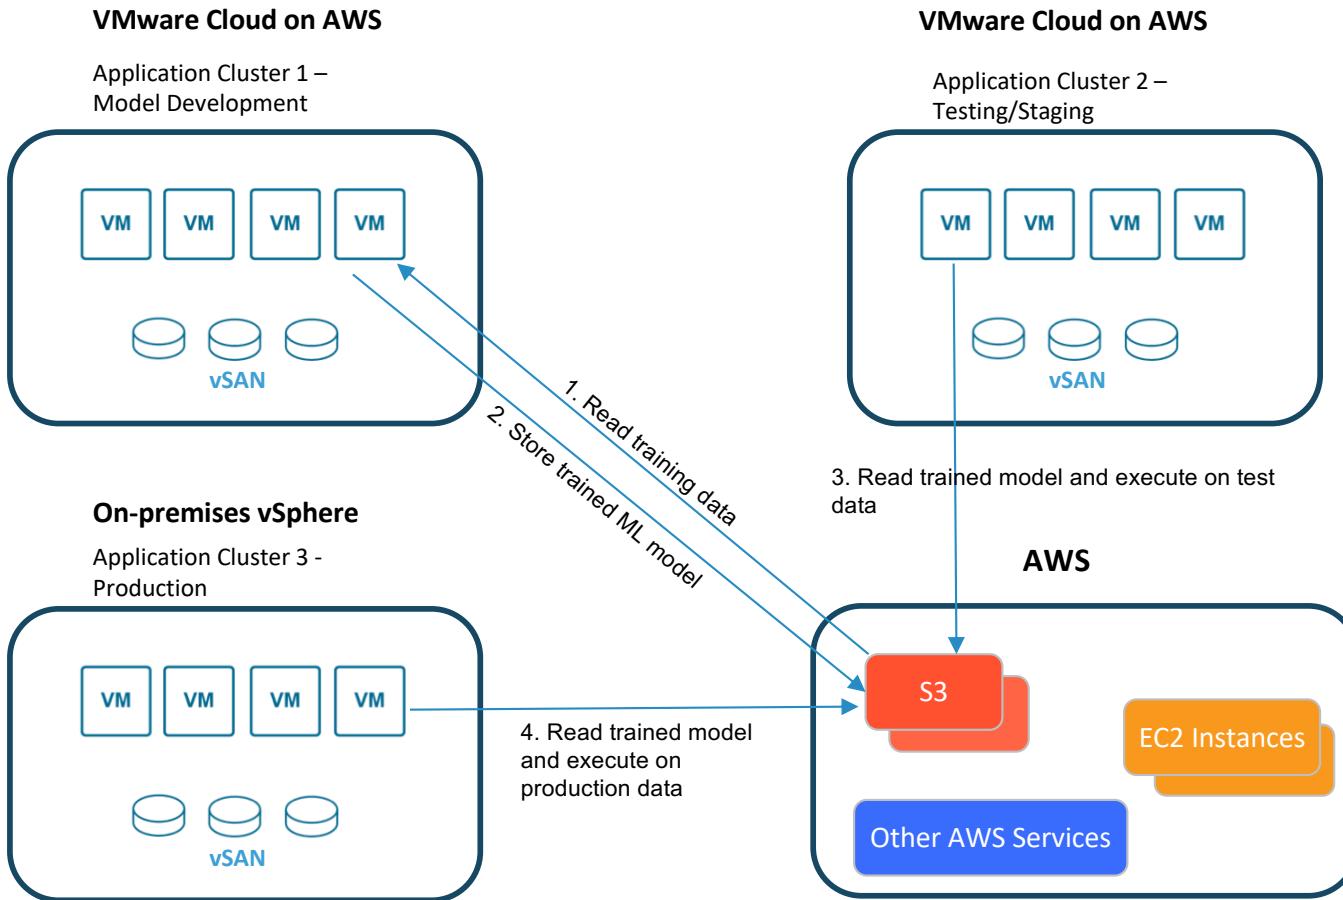

- VMware manages hypervisor and management components
- AWS manages physical resources
- Customer manages VMs
- Customer decides how many VMs to run on vSphere

**VM Summary:**

- Name:** w2-e4d8712486c5
- Status:** Powered Off
- Guest OS:** Photon - Container v1.2.0-rc1, 99999, 3396506
- Compatibility:** ESXI 5.5 and later (VM version 10)
- VMware Tools:** Not running, version:2147483647 (Guest Managed)
- DNS Name:** IP Addresses: Host: 10.144.97.186

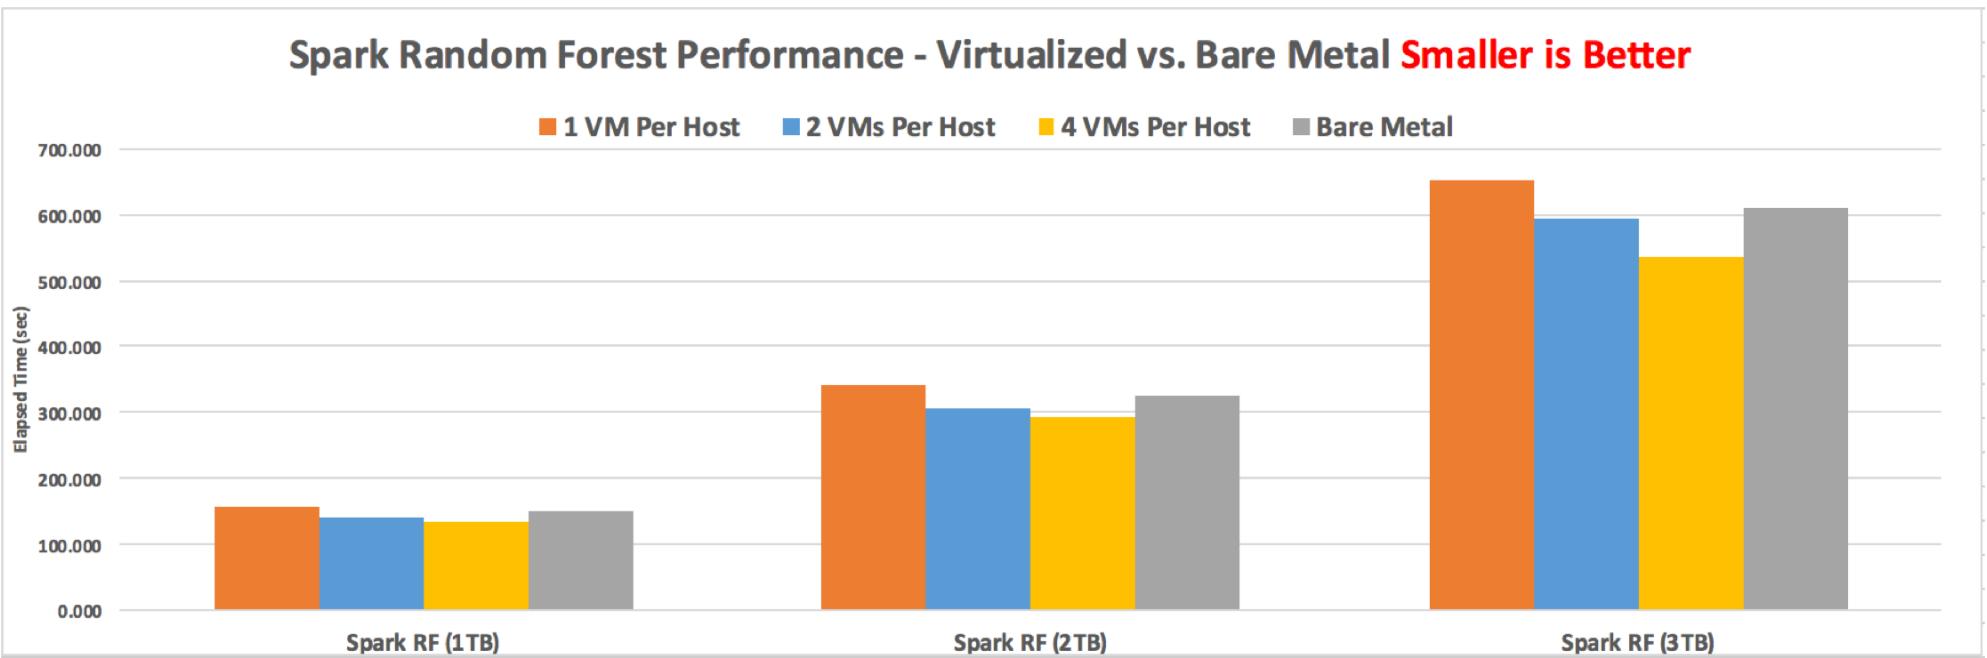

**VM Hardware:**

Hardware Component	Configuration
CPU	2 CPU(s)
Memory	2 GB, 0 GB memory active
Hard disk 1	7.63 GB
Network adapter 1	DVPortGroup1690 (disconnected)
CD/DVD drive 1	Disconnected
Video card	Video card
Serial port 1	Remote tcp://127.0.0.1:2379
Serial port 2	File [datastore1 (!)] e4d8712486c57c5f3368cb26de5425301e6891a9a5d9a402087681d41
Serial port 3	File [datastore1 (!)]

# Performance

# Spark Logistic Regression Performance

Spark Logistic Regression Performance - Virtualized vs. Bare Metal - **Smaller is Better**

## NUMA and Virtual Machine Placement

# Virtualizing Spark - conclusions

## Agility

- Infrastructure on demand
- Sharing of physical resources – not dedicated clusters

## Simplified Management

- Centralized data center management
- Apply virtualization best practices

## Efficiency

- Resource pooling
- Server and cluster consolidation

## Performance

- Equal to, or better performance than native Hadoop
- No significant overhead

# Performance

# Workloads - Spark

- Two standard analytic programs from the Spark MLLib (Machine Learning Library)
- Driven using SparkBench (<https://github.com/SparkTC/spark-bench>)
  - Support Vector Machine
  - Logistic Regression

# Spark Support Vector Machine Performance

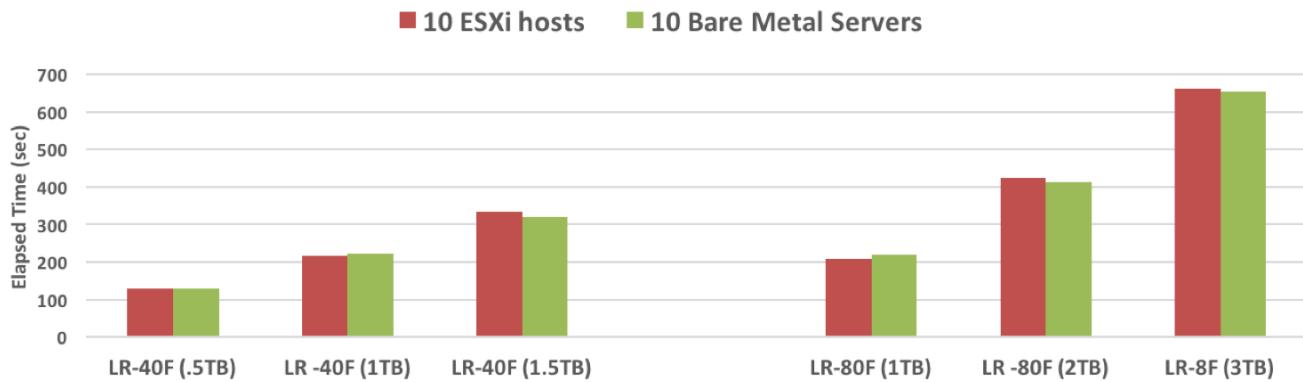

# Spark Logistic Regression Performance

Spark Logistic Regression Performance - vSphere vs. Bare Metal

**Smaller is Better**

Results shown for 40 and 80 Features with 700M, 1.4B and 2.1B Examples

## Results - Spark

- Support Vector Machines workload, which stayed in memory, ran about 10% faster in virtualized form than on bare metal
- Logistic Regression workload, which was written to disk at the larger dataset sizes, showed a slight advantage to bare metal
  - part of the dataset was cached to disk,
  - larger memory of the bare metal Spark executors may help
- Both workloads showed linear scaling from 5 to 10 hosts and as dataset size increased

# Conclusions

- Spark workloads work very well on VMware vSphere
  - Various performance studies have shown that any difference between virtualized performance and native performance is minimal
  - Follow the general best practice guidelines that VMware has published
  - Design patterns such as data-compute separation can be used to provide elasticity of your Spark cluster.
